Regina Lapate, Ph.D

Assistant Professor

Psychological and Brain Sciences

“It’s about time: neural circuitry of affect regulation”

October 20th 10:45am in Psych 1312 (Sage)

A hallmark of the human condition is the experience of continuously shifting emotional spaces. The Lapate laboratory investigates fundamental mechanisms that give rise to subjective (conscious) emotional experiences, determine the influence of emotional signals, and promote adaptive responding to emotional events. The laboratory uses a multimodal approach that emphasizes causal inference, and includes transcranial magnetic stimulation, recordings of peripheral physiology, electroencephalography, and functional neuroimaging—often combined with behavioral assays and analyses anchored in individual differences.
